

ENERGY POLICY

Recognising that the proper use of energy resources is a prerequisite for both its smooth short term productive activity and its long-term sustainability, MEL MACEDONIAN PAPER MILLS S.A., which operates in CARTONBOARD PRODUCTION AND SALE, an inherently energy intensive industry, has developed an Energy Management System in line with international standard ISO 50001:2011. In developing the system, the Management of MEL undertakes:

- To continually strive to improve its energy efficiency by providing the necessary information and ensuring the necessary resources to achieve the quantitative and qualitative goals and objectives it has set in the context of the system.
- To comply with the applicable laws and regulations or other requirements governing energy management
- To use, where technically and financially feasible, renewable energy sources and to encourage the supply of materials and services with a low energy and carbon footprint.
- The supply and use of energy will take into consideration factors, related to climate change.

This Energy Policy is communicated to all parties involved both within and outside the organization, in order to achieve the goals and objectives set in the energy management system through the rational management of energy in all its forms.

MEL has chosen its productive activity within the boundaries of the facilities in the Thessaloniki Industrial Park in Kato Gefyra, Thessaloniki as the first area of application of the Energy Management System.
